JpegSizer Crack+ Free [Mac/Win]

JpegSizer 2022 Crack is a program with a name that pretty much sums up its functionality - it allows you to resize images with the JPEG format. The app's features can be quickly figured out. The tool is wrapped in a standard interface and intuitive layout. Pictures can be imported for processing by using the 'drag and drop' functionality. So, you can use one of the preset profiles for resizing (e.g. Facebook, eBay, Flickr, online printing, email attachments, thumbnails), or create your own ones. After establishing a name for the new profile, you can start configuring the settings. Thus, you can set the pixel size limits, add borders, and adjust the DPI. On top of that, you can apply captions to resized pictures and customize font properties (e.g. text color, alignment), apply watermarks and adjust the transparency level, as well as accurately establish the logo position by inputting the angle and offset values. Additional features of JpegSizer let you convert photographs to other file types, namely GIF, PNG, TIFF and BMP, as well as choose the resampling algorithm. But you can also establish a file naming rule (e.g. add a prefix or suffix to the original filename), modify the default output directory, enable the app to copy the original EXIF information to the output items, and apply timestamps. All settings may be reset to their default values at any time. The software tool needs a low amount of CPU and system memory, has a good response time and quickly finishes a task. Photographs have a good quality after conversion. We have not encountered any issues during our tests, since JpegSizer did not freeze, crash or display errors. There is also a help file available. There are two settings to define the appearance of the edited picture: 1) border; 2) resize mode. This is a really cool app. I have used a lot of free photo resizing softwares, but this one is my favorite. To create the basic settings, you have to give a profile name, then set the pixel and size limits. The other settings can be set only when you have added your own profiles. Picking of the size limits is key. It can be confusing, because there are no unit indicators. If you go into "Advanced" and check the "Use the best size for each object", it will tell you the limits, but it takes a little while to calculate. Creating the basic settings is relatively simple. After that, you have to edit your profile. You can customize the colors (border and background) and the formatting. There is also a nice choice of layouts. The interface of the app is responsive. It works pretty well. You can resample images. It will preserve the EXIF data, so you can use some of it. It also takes in account the IPTC data and dates. You can save the new file name and use it with other software, such as a photo editor. You can also add a watermark. We need to say that the watermark is not always in the right position. The editing of a photo is done in a file of 32 MB, and it takes about 4 to 5 minutes. This is a really good app. I highly recommend it.
